

# What embedded sentences do

*Clausal embedding as modification*

Tom Roberts

Utrecht University

EGG, 7 August 2025

# Introduction

# Setting the stage

There is considerable debate on how attitude verbs compose with embedded clauses.

- (1)      Joaquin believes [that Renee is an oboist]<sub>CP</sub>

# One end of the spectrum

What we've assumed so far: clauses are semantic **arguments** and compose via Function Application (FA), à la Heim & Kratzer

# The other end

Newer view: clauses are verbal **modifiers** and compose intersectively via some flavor of Predicate Modification (PM) (Kratzer 2006; Moulton 2009, 2015; Elliott 2017)

(Verbs and clauses denote **predicates of eventualities**, type  $vt$ )

**Today:** seeing what you can do with this radical departure from the previous three days.

# Why have clausal modifiers?

**Substitutability problems:** (Pietroski 2002 *et seq.*)

- (2)     a.     The receptionist explained that I was too late to enter the building.  
              **Reading 1:** The receptionist said that I was too late to enter, by way of explanation  
              **Reading 2:** The receptionist was themselves the explanation for my being late (e.g., they were doing their job poorly)
- b.     The receptionist explained the fact that I was too late.     (*Reading 1 only*)

Reading 1: complement = the *content* of the explanation (less argument-y)

Reading 2: complement = *object* of the explanation (more argument-y)

**Content nominals:**

- (3)     the (rumor/claim/idea/proposition/conclusion) that Gertrude got out of prison

# Why think nominals don't take clausal arguments

Moulton (2015), following Grimshaw (1990): only nominals with argument structure can be modified by aspectual predicates

- (35) a. I decided that he was a fraud *in 5 minutes*.  
b. \*my decision that he was a fraud *in 5 minutes*  
c. \*my decision *in 5 minutes* that he was a fraud
- (36) a. John proved that he was competent *in only a few minutes*.  
b. \*John's proof that he was competent *in only a few minutes*  
c. \*John's proof *in only a few minutes* that he was competent
- (37) a. I explained *in under an hour* that I was innocent.  
b. \*my explanation that I was innocent *in under an hour*  
c. \*my explanation *in under an hour* that I was innocent
- (38) a. John claimed *for years* that the earth was flat.  
b. \*John's claim *for years* that the earth was flat
- (39) a. John demonstrated that he was a skilled pianist *in just a few short minutes*.  
b. \*John's demonstration *in just a few short minutes* that he was a skilled pianist

# What clausal modifiers can do for you

# A brief interlude

## IMPORTANT SHOUTOUT!!!!

Much of the data I will discuss here was independently observed both by myself and Kajsa Djärv, who unfortunately could not make it to EGG this year.

She has influenced how I think about these problems a lot and is a great linguist, so you are hereby encouraged to check out her work!

## A new puzzle

Many clausal-embedding predicates can also take content DPs, like *the claim* and *the rumor*, as ‘objects’:

- (4) a. Lucretia believes/denies/confirmed [that she is Elena Ferrante]<sub>CP</sub>.
- b. Lucretia believes/denies/confirmed [the rumor/claim/story/lie (that she is Elena Ferrante)]<sub>DP</sub>.

Some verbs also allow non-content DP objects, roughly interpreted as the ‘source’ of the attitude (Djärv 2019, 2021, 2023; Roberts 2020, 2021):

- (5) Lucretia believes the seer/the book/Maude.  
     ≈ Lucretia believes {the seer/the book/Maude}**'s claim**

# Scope of the puzzle

Verbs which are allowed in (5), like *believe* (*trust*, *agree (with)*, *doubt...*) can take both non-content DPs and CPs at the same time.

Crucially, for these verbs, V-DP-CP entails V-CP:

- (6)     Lucretia believes [the seer]<sub>DP</sub> [that she will inherit a great fortune]<sub>CP</sub>.

⊨ Lucretia believes that she will inherit a great fortune.

**Small question:** What is the structure of (6) such that its entailment pattern arises compositionally?

**Bigger question:** What can verbs which ‘take’ both a DP and a CP tell us about how verbs compose with embedded clauses?

# Not just *believe*

Verbs which can embed non-content DP + CP sequences form clear semantic classes:

- (7)     a.    **Verbs of credence:** *agree (with), cite, corroborate, have confidence (in), take at face value, trust...*  
         b.    **Verbs of discredence:** *contradict, counter, disagree (with), dispute, doubt, question, rebut...*

What these verbs have in common: expressing evaluation of the validity of a particular body of information.

→ We want to establish a connection between the semantic features of this class and participation in the *V DP CP* construction.

Focus for today: *believe*

**Claim:** In *believe-DP-CP*, the CP acts as a modifier of the verb; in *believe CP* the CP is an argument of the verb.

## Proposal

Embedded *that*-clauses are flexibly-typed and can function as arguments of transitive predicates or modifiers of intransitive ones, **or transitive predicates with a filled argument slot**

If this is on the right track, suggests both modes of composition are available for embedded clauses, even for the same verb

# The Structure of V-DP-CP

# Word order

The DP in the V-DP-CP construction always precedes the CP:

- (8) a. She believes [the reporter]<sub>DP</sub> [that it will snow tomorrow]<sub>CP</sub>.
- b. \*She believes [that it will snow tomorrow]<sub>CP</sub> [the reporter]<sub>DP</sub>.

Stacking 2 DPs or 2 CPs is also ruled out:

- (9) a. \*She believes [the reporter]<sub>DP</sub> [the rumor]<sub>DP</sub>.
- b. \*She believes [that it will snow tomorrow]<sub>CP</sub> [that today is Saturday.]

# Constituency

When the DP is non-content-denoting, the postverbal DP and the CP do not form a constituent:

- (10) *Fragment Answer*  
A: What/who does Lucretia believe?  
B: (\*Maude/✓ the book) that it's raining.  
(cf. ✓ the rumor that it's raining)
- (11) *Clefting*  
\*It is Maude/the book that it's raining that Lucretia believes.
- (12) *Pseudoclefting*  
\*Maude/the book that it's raining is what Lucretia believes.

# Comparison with content nominals

Composing content DPs composing with clauses intersectively:

$$(13) \quad \llbracket \text{the claim that it's raining} \rrbracket = \\ \iota x_e [\mathbf{claim}(x) \wedge \mathbf{CON}(x) = \lambda w_s. \mathbf{rain}(w)]$$

The CP in V-DP-CP has a similar distribution to the CP taken by content DPs, suggesting the mode of composition is the same.

# External distribution

## **CP proforms** (Moulton 2015):

- (14) a. Hobart believes so/it/that.
- b. \*Hobart's belief so/it/that
- c. \*Hobart believes Mildred so/it/that.

## **About-PPs** (Rawlins 2013):

- (15) a. \*Hobart believes about the rain.
- b. Hobart's belief about the rain.
- c. Hobart believes Mildred about the rain.

## **Obligatory overt C:**

- (16) a. Hobart believes (that) it's raining.
- b. Hobart's belief \*(that) it's raining
- c. Hobart believes Mildred \*(that) it's raining.

The CP in V-DP-CP constructions is also an island; this is not so if the DP is absent.

## **Object DPs block A' extraction from the embedded CP**

- (17)    a.    What<sub>*i*</sub> do you believe (??Maude) that she ate *t<sub>i</sub>*?  
         b.    [the kiwi]<sub>*i*</sub> that Hugh believes (\*Maude) that she ate *t<sub>i</sub>*

→ This suggests this CP is not in a syntactic argument position.

# Summing up

The CP in *believe*-DP-CP has a largely ‘peripheral’ syntactic status:

- ✦ It does not form a constituent with the adjacent DP
- ✦ It has the external distributional of a semantic modifier
- ✦ It is an (adjunct)-island
- ✦ It is optional

...all ways it is *unlike* the embedded CP when the object DP is not present with the same V...

**...suggesting the CP has a fundamentally different status when the object DP is present vs. when it is not.**

# Analysis

## When clauses are modifiers

In *believe-DP-CP*, the DP is an internal argument of *believe* while the CP modifies the content of the believing eventuality.

This is achieved via a type asymmetry between *that*-clauses and contentful individuals:

- ✚ (Content) DPs denote **contentful individuals** and compose via FA
- ✚ *That*-clauses denote **predicates of eventualities** and compose via PM

*Believe DP that CP* constructions have the following LF:

(18)

# The meaning of *believe*

**Idea:** *believe* denotes a Kratzer (1996)-style function from contentful individuals to properties of eventualities (type  $\langle e, vt \rangle$ ):

$$(19) \quad \llbracket \text{believe} \rrbracket = \lambda x_c \lambda e_v. \mathbf{believe}(e) \wedge \text{CON}(x) = \text{CON}(e)$$

*Believe* takes a contentful individual  $x_c$  ( $D_c \subseteq D_e$ ), and equates its content to that of a believing eventuality.

This is a departure from a total neo-Davidsonian approach to lexical semantics, whereby all arguments are severed from the verb

# Extracting content from individuals

A non-content DP like *Maude* cannot saturate the individual argument of *believe* on its own.

We need a mechanism to turn it into a contentful individual of the relevant sort, which I cash out with the operator CLAIM:

$$(20) \quad \llbracket \text{CLAIM} \rrbracket^w = \lambda y_{e.\iota x_c} [\text{CON}(x_c)(w) = \text{CON}(\mathbf{claim}(y)(w))]$$

CLAIM denotes a function from individuals to the unique contentful individual with the same content as their claim in  $w$

# Composing with the CP

I assume that *that*-clauses denote predicates of eventualities (?):

$$(21) \quad \llbracket \text{that it's raining} \rrbracket^w = \lambda e_v. \text{CON}(e)(w) = \lambda w'_s. \mathbf{rain}(w')$$

Because *that*-clauses and *believe DP* denote the same type of formal object, they must compose intersectively, via a mechanism like Restrict (Chung & Ladusaw 2004):

$$(22) \quad \text{For type } \alpha \text{ and type } \beta \text{ such that } \beta = \langle \beta_1 \langle \dots \langle \beta_n t \rangle \rangle \rangle \text{ for some } n \geq 0, \\ \text{Restrict}(A_{\langle \alpha \beta \rangle}, B_{\langle \alpha t \rangle}) = \lambda x \in D_\alpha. \lambda y_1 \in D_\beta \dots \lambda y_n \in D_\beta. A(x)(y_1) \dots (y_n) \wedge B(x)$$

# Putting the pieces together

Example VP: *believe Maude that it's raining*

## Procedural steps

1. Compose *Maude* with CLAIM via FA
2. Compose the CLAIM-DP with *believe* via FA
3. Compose *believe*+CLAIM-DP with the embedded CP via Restrict.

(23)  $\llbracket \text{believe Maude that it's raining} \rrbracket$   
 $\lambda e_v. \mathbf{believe}(e) \wedge (\text{CON}(e) = \text{CON}(\iota x_c [\text{CON}(x_c)(w) =$   
 $\text{CON}(\mathbf{claim}(\mathbf{m})(w))])) \wedge \text{CON}(e) = \lambda w'_s. \mathbf{rain}(w')$

(Roughly, ‘believe Maude’s unique claim and believe that it’s raining’)

## When clauses are arguments

A problem: sentences with an embedded *that*-clause and no DP:

(24)     Lucretia believes that it's raining.

This composition cannot proceed given our assumptions because of the type mismatch between *believe* ( $\langle e, vt \rangle$ ) and the *that*-clause ( $vt$ )

**Solution:** Permit *that*-clauses to be coerced into contentful individuals so that they may saturate verbal arguments

# Coercing *that*-clauses

Close kinship between eventualities and contentful individuals: many authors treat the former as a subset of the latter (Lasnik 1995; Hacquard 2006; Elliott 2017).

Proposal: *that*-clauses can flexibly denote a unique contentful individual, independently proposed by Potts (2002).

$$(25) \quad \llbracket \text{that it's raining} \rrbracket = \iota x_c [\text{CON}(x_c) = \lambda w_s. \mathbf{rain}(w)]$$

$$(26) \quad \llbracket \text{believes that it's raining} \rrbracket = \\ \lambda e_v. \mathbf{believe}(e) \wedge \text{CON}(e) = \text{CON}(\iota x_c [\text{CON}(x_c) = \\ \lambda w_s. \mathbf{rain}(w)])$$

# Conclusion

# Wrapping up

Proposed here is that embedded *that*-clauses live a double life:

- ✦ They can **denote contentful individuals** and saturate content arguments of transitive predicates...
- ✦ ...or **denote predicates of eventualities** and modify event arguments of transitive predicates whose argument has been saturated.

This compositional flexibility is achieved by allowing *that*-clauses a degree of denotational flexibility.

# Looking ahead

Much remains to be understood:

- ❖ Given the semantic generalizations among verbs which permit V-DP-CP, what implications are there for the lexical semantics-syntax interface?
- ❖ What can the cross-linguistic picture tell us? (See Appendix)
- ❖ Are there clear interpretive differences when a CP denotes an individual vs. a predicate of eventualities?
- ❖ What is the source of ungrammaticality when the CP in *believe-DP-CP* is questioned?

(27) \*What did you believe Maude?

## Appendix: Deriving *believe-DP-CP*

# Derivation

Example: *believe Maude that it's raining:*

## Step 1

Compose *Maude* with CLAIM via FA

# Derivation

## Step 2

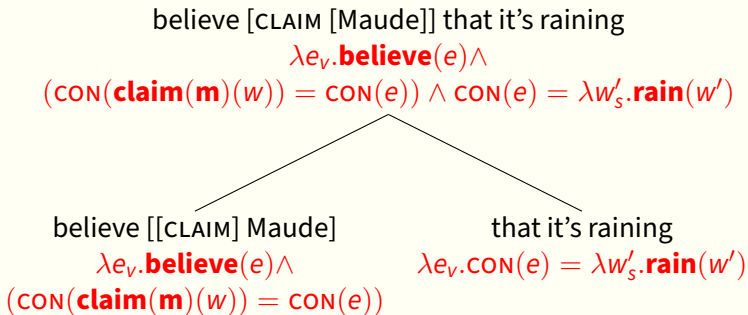

Compose the CLAIM-DP with *believe* via FA

$$\begin{array}{c} \text{believe} [\text{CLAIM} [\text{Maude}]] \\ \lambda e_v. \text{believe}(e) \wedge (\text{CON}(\iota x_c [\text{CON}(x_c)(w) = \text{CON}(\text{claim}(\mathbf{m})(w))]) \\ \quad = \text{CON}(e)) \\ \swarrow \quad \searrow \\ \text{believe} \qquad \text{CLAIM} [\text{Maude}] \\ \lambda x_c \lambda e_v. \text{believe}(e) \wedge \quad \iota x_c [\text{CON}(x_c)(w) = \text{CON}(\text{claim}(\mathbf{m})(w))] \\ \text{CON}(x_c) = \text{CON}(e) \end{array}$$

# Derivation

## Step 3

Compose *believe*+CLAIM-DP with the embedded CP via Restrict.

# Why DP-CP?

# Why can't CPs be stacked?

Given that a CP can denote an argument or a modifier of *believe*, we need an explanation for why we can't stack CPs:

- (28) \*Mathison believes [that Ulysses is in Moldova]<sub>CP</sub> [that it's raining ice cream]<sub>CP</sub>.

This yields the denotation below:

- (29)  $\lambda e_v. \mathbf{believe}(e) \wedge (\text{CON}(e) = \lambda w_s. \mathbf{in-Moldova}(\mathbf{u})(w))) \wedge$   
 $(\text{CON}(e) = \lambda w_s. \mathbf{rain-ice-cream}(w))$

Assuming that *e* corresponds to a single believing eventuality, it has incoherent content corresponding to two different propositions.

# The thematic role of the DP

# The problems with CLAIMing

The use of CLAIM to turn non-content DPs into content DPs generates at least two problems:

- ❖ **Overgeneration:** Clearly, we cannot turn *John* into [CLAIM *John*] in most contexts
- ❖ **Claimhood:** Not every entity which can be *believed* makes claims.

- (30)
- The jury believed the photograph that the defendant is guilty.
  - I trust the recording that there is a grand conspiracy.

## An alternative: Sourcehood

We could treat the DP object of *believe* as a *source* argument, (cf. Djärv 2019). This would solve the second problem, since both claims and non-claims can presumably be sources of beliefs.

Though as Djärv herself notes, we do not want to say that *believe* s-selects a source, because *believe CP* imposes no source requirement in the absence of an object DP.

(31) I believe that it's raining, even though no one claimed that.

Having a flexible content argument for *believe* circumvents this issue. However, we probably want the semantics of the object DP to be essentially that of a source; this could be achieved with fine-tuning the denotation of CLAIM.

# Beyond English

## Other languages with *believe-DP-CP*

*Believe-DP-CP* is not unique to English, as Djärv (2019) observed for German. It is also licit in Estonian:

(32) **Estonian**

Ma usun Liisi, et koroonaviirus on ohtlik.  
I believe Liis.PART that coronavirus is dangerous  
'I believe Liis that coronavirus is dangerous.'

# Languages which prohibit *believe-DP-CP*

In some languages, *believe* can take a DP or a CP, but not both at once:

(33) **Canadian French**

Marie croit Gaston (\*qu'il a cambriolé une banque).  
Marie believes Gaston that.he has robbed a bank  
'Marie believes Gaston (\*that he robbed a bank).'

(34) **Turkish** (Deniz Özyıldız, p.c.)

Anna Brian'a (\*Brian'in partide oldugun-a) inanıyor.  
Anna Brian.DAT Brian.GEN party.LOC be.NMZ-DAT believe  
Anna believes Brian (\*that Brian was at the party).

# The dative/applicative connection

Djärv (p.235) motivates an analysis of German *glauben* in which the source argument is introduced by an applicative head, in part because it is obligatorily dative.

- (35) Ich glaube ihm/\*ihn, dass Hans Maria das Buch gab.  
I believe him.DAT/ACC that Hans Maria the book gave  
'I believe him that Hans gave Maria the book.'

In Turkish (34), both the (nominalized) embedded clause and the source on their own must be dative-marked; their inability to co-occur could therefore be chalked up to Case restrictions.

# The dative/applicative connection

However, we should be wary about putting all our eggs in the dativity basket:

- ✦ Canadian French *croire* object DPs are not dative, but CPs are not allowed
- ✦ Estonian *uskuma* allows DP+CP combinations, but the object DP is not dative (read: oblique)

The connection between dative case and the (in)ability to form *believe-DP-CP*-like constructions merits much further investigation (and on many verbs in many languages!)
